

Cover Letter — Sensors (MDPI)

14 July 2026

Dear Editors of *Sensors*,

On behalf of my co-authors, I am pleased to submit our original research article, “**Quantum Oracle Sketching for Non-IID Sensor and Telemetry Streams: A Proxy-Based Computational Study**”, for consideration in *Sensors* (suggested section: Sensor Networks / sensor-data processing).

What the paper does. Sensor and telemetry streams are rarely IID: they mix short-term Markov structure, seasonal cycles, burst repetition, and long-range dependence. This paper asks where quantum oracle sketching — a recently proven route to exponential memory advantage for streaming learning — remains viable under exactly these correlation patterns. We introduce two operational, estimator-friendly correlation parameters (refreshing time τ and repetition number r), evaluate five structured stream regimes against three classical memory-bounded baselines (10 seeds, 95% CIs, paired Wilcoxon tests), and produce a (τ, r) sensitivity landscape on which any measured stream can be placed. The framework is demonstrated end-to-end on two real telemetry streams from the Numenta Anomaly Benchmark — NYC Taxi demand and an industrial machine-temperature sensor series — which land on opposite sides of the favourable region, with imbalance-aware metrics (balanced accuracy, F1) exposing majority-class effects.

Fit to Sensors. The contribution is a data-processing viability map for sensor-style streams: it gives practitioners a cheap, measurement-based procedure (estimate τ and r from a stream sample) to decide whether emerging quantum streaming approaches are worth prototyping for their telemetry workload, and it is validated on genuine sensor data. The manuscript is prepared in the official MDPI template.

Declarations. The manuscript is original, unpublished, and not under consideration elsewhere. All authors approved the submission. No competing interests; no external funding (no APC waiver requested). A generative-AI-assistance declaration is included per MDPI policy. All code and data are open (Zenodo DOI: 10.5281/zenodo.19831893, MIT licence); every figure and table regenerates from seeded scripts.

Suggested reviewers: [to be entered by the authors in the submission system].

Thank you for considering our work.

Sincerely, on behalf of all authors,

AbdelMoniem Helmy (corresponding author) Taibah University, Yanbu, Saudi Arabia; and Department of Information Systems and Technology, Faculty of Graduate Studies for Statistical Research, Cairo University, Cairo, Egypt abdelmoniem.hafez@cu.edu.eg · ORCID 0000-0001-5996-6019
